

The graph displays the gmean IPC improvement (%) on the y-axis (ranging from -50 to 100) against the Accuracy threshold on the x-axis (ranging from 0 to 125). The blue line, representing the top-performing model, shows a significant improvement starting at an accuracy threshold of 20, reaching nearly 100% improvement, and maintaining this level until an accuracy threshold of 110. It then drops to 0% at 115 and spikes back to 100% at 125. Other models (orange, green, brown, purple, pink) show much lower improvement, generally staying below 10% improvement across the entire accuracy range.
